

Unit 12 - Tales from the Crypto

1. Sentiment Analysis

Use the [newsapi](#) to pull the latest news articles for Bitcoin and Ethereum and create a DataFrame of sentiment scores for each coin.

Use descriptive statistics to answer the following questions:

1. Which coin had the highest mean positive score?
2. Which coin had the highest negative score?
3. Which coin had the highest positive score?

```

Questions:

Q: Which coin had the highest mean positive score?

A: *Bitcoin*

Q: Which coin had the highest compound score?

A: *Bitcoin, but only by a tiny margin*

Q: Which coin had the highest positive score?

A: *Ethereum*

In this section, you will use NLTK and Python to tokenize the text for each coin. Be sure to:

- ```
from nltk.tokenize import word_tokenize, sent_tokenize
from nltk.corpus import stopwords
from nltk.stem import WordNetLemmatizer, PorterStemmer
from string import punctuation
import re
```

```
Complete the tokenizer function
Let's create a new function to pull ALL news items containing BITCOIN and ETHEREUM. The previous variables separately created, BTC and ETHEREUM.
We need them to pull together, so we can tokenize all information at the same time

def tokenizer(text):
 """Tokenizes text."""
 sw = set(stopwords.words('english'))
 regex = re.compile("[^a-zA-Z]")
 re_clean = regex.sub('', text)
 words = word_tokenize(text)
 words = list(filter(lambda w: w.lower() not in sw, words))
 words = list(filter(lambda t: t not in punctuation, words))
 words = list(filter(lambda t: t.lower() not in text, words))
 lemmatizer = WordNetLemmatizer()
 tokens = [lemmatizer.lemmatize(word) for word in words]
 print(words)

 return tokens
```

NGrams and Frequency Analysis

In this section you will look at the ngrams and word frequency for each coin.

- 1. Use NLTK to produce the n-grams for N = 2.
- 2. List the top 10 words for each coin.

In [35]: from collections import Counter  
from nltk import ngrams  
  
# to get a good sense of what data is requested on the news api - we need to first  
# get some accurate word counts.

In [39]: # Generate the Bitcoin N-grams where N=2  
#N=2  
  
btc\_grams = ngrams(tokenizer(btc\_df.text.str.cat()), n=2)  
#print(dict(btc\_grams))  
  
Counter(btc\_grams).most\_common(20)
